Patent No. 5536636
GENERAL INFORMATION:
APPLICANT: Freeman Jr., Robert M.
APPLICANT: Plutzky, Jorge
APPLICANT: Neel, Benjamin G.
APPLICANT: Nosenberg, Robert D.
TITLE OF INVENTION: IDENTFICATION OF NOVEL TYROSINE
TITLE OF INVENTION: PHOSPHATASES HAVING SH2 DOMAINS
NUMBER OF SEQUENCES: 54
CORRESPONDENCE ADDRESS:

The Lyp9 gene has been localised to human chromosome Lpl3. It is expressed significantly in fetal liver and in resting lymphoid cells. The Lyp2 gene sequence arises by alternative splicing of the Lyp1 mRNA and the coding sequence reads into the intronic sequence of Lyp1 till a termination codon is encountered. Lyp gene products are important for regulation of T cell antigen and cytokine receptor signalling and for early and late stages of T cell differentiation. Lyp2 has immunosuppressive activity. This sequence is used to treat lymphoma, to reduce or prevent T cell activation or proliferation and to control thymccyte differentiation. Fragments of this gene are used, as probes or primers, to identify allelic variations and for diagnosis of diseases associated with reduced Lyp activity. Transgenic animals in which a Lyp gene has been inactivated or replaced the cannel of the control thymcotty and screen for possible
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Lymphoid Protein Tyrosine Phosphatase gene; Lyp gene; immunosuppressant; intracellular tyrosine phosphatase; PrPase; lymphocyte; fetal liver; resting lymphoid cell; protein tyrosine kinase; PTKs; transgenic animal; lymphoma; T cell antigen receptor signalling; intronic sequence; cytokine receptor signalling; protein tyrosine phosphatase; PTPase; ds.

The present cDNA sequence is that of the Lymphoid Protein Tyrosine
Phosphatase gene, Lyp 1 that encodes a cytoplasmic tyrosine phosphatase
protein with a single catalytic domain. The Lyp gene has been localised
to human chromosome lpl3: It is expressed in the lymphoid cells,
particularly in thymocytes, mature B and T cells. It is involved in
lymphocyte growth and development. Lyp gene products are important for
regulation of T cell antigen and cytokine receptor signalling and early
and late stages of T cell differentiation. Lyp 1 has immunosuppressive
cutivity. This sequence is used to treat lymphoma, to reduce or prevent
T cell activation or proliferation and to control thymocyte
differentiation. Fragments of this gene are used, as probes or primers,
to identify allelic variations and for dispnosis of diseases associated
with reduced Lyp activity. Transgent animals in which a Lyp gene has
been inactivated or replaced by a heterologous Lyp gene are used to
New nucleic acid encoding intracellular tyrosine phosphatase and related proteins, used to modulate signalling through T cells, particularly as immunosuppressant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            100

The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The resent sequence encodes human PTP04. The above proteins. The present sequence encodes human PTP04. The above proteins. There is the resent sequence encodes human PTP04. The above proteins, other than a LK-7, are protein tyrosine phosphatases (PTPs) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and humans), while modulators of ALK-7 (which is a type I receptor serine/threonine kinase) are used to promote neuronal survival, particularly for treating Alzhahemr's, Parkinson's or Huntington's diseases. Nucleic acid fragments of the polynuclectides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in generate therapy (optionally after mutation). Ab are used to determine the proteins.

                                                                                                                                                                                                                  seq_name: /net/abss06/SIDS1/gcgdata/hold-geneseq/geneseqn-emb1/NA2002.DAT:AB199910
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 conditions, comprising measuring the expression levels of particular genes (I) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (I). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia or vasospaatic ischaemia) by measuring the protein sequences in ABB57020 to ABB57374) or by determining the expression levels of particular genes (ABI99202 to ABB99912, encoding the protein sequences in ABB57020 to ABB57374) or by determining the expression profile of a gene group comprising these genes. The expression levels or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition improving drugs or therapeutics for ischaemic diseases. ABI99913 and ABI99914 represent PCR primers for a mouse ischaemic condition related sequence, which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Examining the ischemic condition (e.g. occlusive ischemia) by measuring expression levels of particular genes defined in the specification or by determining the expression profile of a gene group comprising these

proteins AAB58711 - AAB59128. The DNA and protein sequences are associated with breast and ovarian cancer. Included in the invention are sequences AAF22040 and AAB59129 which are used in the sequences AAF22040 and AAB59129 which are used in the sequences AAF22040 and AAB59129 which are used in the invention and characterisation of the DNA and protein sequences of the invention. The breast and ovarian cancer associated DNA, protein, agonist or antagonist sequences exhibit cytostatic; immunosuppressive; nootropic; neuroprotective; antivital; antialergic; hepatotropic; antidiabetic; antiinflammatory; antialergic; hepatotropic; antidiabetic; antiinflammatory; antialergic; hepatotropic; antidiabetic; antiinflammatory; antibores; so antidiabetic; antiportial; antiporasis of cancer. The nucleic acid sequences, particularly breast and ovarian cancer. The nucleic acid sequences, particularly breast and agonists may also be used in the diagnosis, prevention and treatment of immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crooh's disease, multiple sclerosis, rheumatoid myocardial ischaemias; wound healing; neurological diseases such as myocardial anoxia and epilepsy; and infectious diseases.
                                                                                       New human breast and ovarian cancer associated gene sequences and the polypeptides encoded by these genes, useful in the prevention, treatment and diagnosis of cancer, immune disorders, cardiovascular disorders and neurological diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            544
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      478 H1sAspSerCysPheValGluMetGlnAlaGlnLysValMetHisValSe 494

using primers based on consensus sequences (see AAW49915-16) of known PTPs. The invention relates to novel proteins (see AAW49915-16) of known involved in cellular signal transduction and to the nucletc acids (see AAV17097-99) coding for them, and provides vectors, host cells, purified recombinant proteins, methods for identifying compounds that bind the novel proteins or abrogate their interactions with natural binding partners, as well as methods for the diagnosis and treatment of diseases associated with the novel proteins. For PTP20, activators may act as anti-cancer therapeutics that stimulate cell differentiation rather than proliferation, while inhibitors may be useful for treating neural injuries by delaying the differentiation of transplanted neuronal stem cells until they are firmly grafted.

The present sequence encodes a novel murine non-receptor protein tyrosine phosphatase of hematopoietic stem cells (PTP HSC). This protein is protein is prodeminantly expressed in early hematopoietic stem cells (HSCs) or predominantly expressed in early hematopoietic stem cells (HSCs) or progenitor cells, and lack expression in adult tissues. The protein has a N-terminal tyrosine phosphatase domain, followed by a region rich in serine, threonine and proline and a C-terminal region of about 15-25 amino acids which is rich in basic amino acid residues. The protein is capable of tyrosine dephosphorylation in hematopoietic progenitor cells, and functional derivatives of such native tyrosine phosphatases. The phosphatase domain of the PTP HSC or a PTP HSC-expressing HSC or progenitor cell can be used in an assay for the identification of PTP HSC or andifferentiated malignant hematopoietic cells, e.g. leukaemia cells, which may facilitate their hematopoietic cells, e.g. leukaemia cells, which may facilitate their treatment. The PTP HSC or an agonist antibody against the PTP HSC or an agonist the PTP HSC can be used for the expansion of undifferentiated stem cells in cell culture can be appeared by the contraction of the expansion of undifferentiated stem cells in cell culture can be used for the expansion of the contraction of t
                                                                                                                                                                                                                                                                                                                                         Hematopoietic stem cell non-receptor protein tyrosine phosphatase - useful for expansion of undifferentiated stem cells in cell culture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          marrow transplantation), while the agonist antibody along with a hematopoietic growth factor can be used for the expansion of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           laAsnPheIleLysGlyValTyrGlyProLysAlaTyrIleAlaThrGln 103

This cDNA sequence codes for a novel human protein tyrosine phosphatase (PTP), designated brain derived phosphatase 1 (BDP-1, see AAW49908), that is expressed in most tissues and cell lines at basal level, but expressed high in epithelium origin cell lines and cancer cell lines. BDP-1 was originally identified in a human brain cDNA library, although the full-length clone was isolated from the haematopoietic MEG01 CDNA library. The invention relates to novel proteins (see AAW49906-14) involved in cellular signal transduction and to the nucleic acids (see AAV17097-99) coding for them, and provides vectors, host cells, purified recombinant proteins, methods for identifying compounds that activate or inhibit the novel proteins, as well as methods for the diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New phosphatase and kinase enzyme(s) - useful in the diagnosis and treatment of signal transduction disorders

The fusion protein is used in an assay to exemplify the invention. The specification describes how quantitative information about the influence of a molecule on a cellular response is obtained by recording the variation, caused by the molecule, on mechanically intact living cells, in the spatially distributed light emitted from a luminophore present in the cells. The variation in light emission is processed to provide information that correlates spatial distribution to the degree of the molecule. The method is used to identify agents that (in)directly affect intracellular signalling, especially to screen for potential therapeutic agents or toxins, and to identify new drug targets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Protein tyrosine phosphatase 1C-green fluorescent protein fusion product

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Degenerate primers (see AAT06028-29) corresp, to conserved protein tyrosine phosphatase (PTP) amino acid sequences were used to prime a PCR with a HeLa cell cDNA library as template. An isolated clone was used to screen an oligo-dr-primed HeLa cDNA library. A cDNA clone was obtd. (given in AAT06027) that encoded a novel density-enhanced Type III receptor-like PTP, designated hubbP-1 (AAR85203). Expression of the cDNA in host cells allows large-scale prodn. of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nerropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression. Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence data for this patent did not form part of the printed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) and (II) and (II) and (II) are useful for treating

disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2948
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2998

as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers in the feature table with their source databases: Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence chromosome 1, constructed by the Sanger Centre Chromosome 1 Mapping
                                                                                                                                                                                                                                                                    Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr1 RP5-107303 is from the library RPCI-5 constructed by the group of Pieter de Jong. For further details see
                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence is the entire insert of clone RP5-107303 The true right end of clone RP11-215C20 is at 30467 in this sequence. The true right end of clone RP11-324J2 is at 119169 in this sequence. Location/Qualifiers

On Jul 19, 2001 this sequence version replaced gi:14566004.

During sequence assembly date as compared from overlapping clones.

Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation may not be found in the sequence submission only a small overlapping clone, as we submit sequences with an all overlapping clone, as we submit sequences with residence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AL137856 143618 bp DNA linear PRI 17-JUL-2001
